## DETAILED ACTION

### *Claim Objections*

1. Claims 5-6 objected to under 37 CFR 1.75(c) as being in improper form because a multiple dependent claim 5. See MPEP § 608.01(n). Accordingly, claims 5-6 have not been further treated on the merits.

### *Claim Rejections - 35 USC § 103*

2. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-2 are rejected under 35 U.S.C. 103(a) as being unpatentable over Allred, US 6,310,982.

In considering claims 1-2,

Allred discloses a Temporal Recursive Filter (Figs 1,2) which reduces motion artifacts and noise in a video image. Allred discloses that the output (feedback) of the filter is derived by taking a weighted average of the differences values and the motion value which includes (i) the average of the difference values surrounding the pixel of interest (motion value "M"), (ii) the difference of the value of the pixel of interest, and a value that is some ratio or combination and (iii) a value that is some ratio or combination of (i) and (ii) (col 5, line 1-12).

However, Allred does not explicitly disclose the claimed *regarding the smaller one of the factors determining the feedback factor*.

It is conventional in the art when determining motion in an image to utilize either the lower or higher motion value based upon whether the image is still/moving, since pixels which indicated higher motion between frames is indicative of more noise.

Thus, the examiner takes "OFFICIAL NOTICE" regarding a system that utilizes a smallest factor of motion within an image in determining the feedback of a system, since the smallest motion detects is typically indicative of less noise.

Therefore it would have been obvious to one of ordinary skill in the art at the time of the invention to modify Allred which discloses the determining the output/feedback of a system based upon the amount of noise detected between a pixel of interest and surrounding pixels in two different frames, by utilizing conventional feedback schemes which determine that the larger motion value is indicative of more noise, and thus utilizing the lower value would reduce unwanted variations/artifacts into the output signal.

### ***Allowable Subject Matter***

3. Claims 3-4 are objected to as being dependent upon a rejected base claim, but would be appear allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

### ***Conclusion***

4. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure—please see newly cited references on attached form PTO-892.

publicly available. EFS allows customers to electronically file patent application documents securely via the Internet. EFS is a system for submitting new utility patent applications and pre-grant publication submissions in electronic publication-ready form. EFS includes software to help customers prepare submissions in extensible Markup Language (XML) format and to assemble the various parts of the application as an electronic submission package. EFS also allows the submission of Computer Readable Format (CRF) sequence listings for pending biotechnology patent applications, which were filed in paper form.
